

[T]-Theory: Law

P13 · Capstone · For: The Legal Scholar

The Rights Invariant — legal norms as topological field invariants.

Law as field theory:

- Legal norms = attractor basins in social BRECVEMA space
- Rights = **topological invariants** — stable under continuous deformation
- Precedent = somatic memory kernel $K(\tau)$ for the legal system
- Constitutional change = phase transition in the legal field

The G-Identification for Law:

- G_{law} = topological propagator for norm diffusion
- Rights are invariant under perturbation if topologically protected
- Positive law = local field configuration (deformable)
- Natural rights = topological charge (conserved)

I · The Rights Invariant

A legal right R is a topological invariant of the social field if:

$$\oint_{\gamma} \nabla R \cdot d\mathbf{x} = n \in \mathbb{Z} \quad \forall \gamma$$

Non-zero winding number n = the right is **topologically protected**. It cannot be removed by smooth deformations of the legal field — only by a phase transition (revolution, constitutional crisis).

This is the USF version of the argument from natural law.

II · Precedent as Field Memory

The common law principle of *stare decisis* $\equiv$ the legal system's memory kernel:

$$G_{\text{precedent}}(\tau) = G_0 e^{-\tau/\tau_{\text{law}}}$$

Older precedents decay exponentially; recent cases dominate. τ_{law} varies by jurisdiction: constitutional courts have long memory (τ_{law} = decades); administrative tribunals have short memory (τ_{law} = months).

III · Constitutional Attractors

A constitutional order = a deep attractor basin in the space of legal configurations. Features:

- **Stability**: high energy barrier to leave the basin
- **Amendment procedure**: the basin-reshaping mechanism
- **Constitutional moment**: Ackerman's theory = a phase transition
- **Failed states**: field without stable attractor = constitutional breakdown

IV · Mathematical Co-identification

$$\text{Legal precedent} \equiv G_{\text{law}}(\tau) \equiv K_{\text{somatic}}(\tau)$$

The mechanism of legal memory is structurally identical to somatic memory. The same differential equation governs both. Only the substrate differs.
