

The [T]-Theory Phenomena: Self-Propagating Field Dynamics and the Cultural Programme

A Scale-9 Fixed Point and the Substrate-Independent Propagator

Abstract

Two companion papers on the cosmological constant and spatial-vacuum dark matter propose that dimensional counting yields the cosmological constant $\Lambda \equiv \langle \text{tr } \Phi \rangle_0$ and the dark matter fraction $\Omega_{\text{DM}} = 3/11$ from M-theory dimensional counting alone. This paper addresses what follows: it proposes that the Universal Somatic Field framework can be studied as a **fixed point of its own subject matter**. Its propagation through physical and digital substrates is treated as an instance of Scale 9 swarm dynamics governed by the same Green's function that describes its clinical, quantum, and cosmological applications. The physical substrate (underground events, street art, live performance) and the digital substrate (source code, fibre-optic networks, AI context windows) are proposed as comparable propagation media. This is a programme hypothesis, not a proof of physical equivalence. It introduces the [T]-Theory cultural and cross-domain programme.

The Fixed-Point Property

The Universal Somatic Field programme now includes companion papers on the cosmological constant (Johnson, 2026b) and spatial-vacuum dark matter (Johnson, 2026a). They propose dimensional-partition accounts of these sectors and report leading-order numerical comparisons. The programme began with a clinical question (what is an emotion, formally?) and now reaches cosmological hypotheses about the vacuum energy of three spatial dimensions.

This paper asks a different question: **what kind of thing is [T]-Theory itself?**

The proposal developed below is that [T]-Theory can be treated as a phenomenon of scale-9 field dynamics. Its spread through culture, code, and community can be modelled using propagation, coupling, and attractor concepts. This is a programme-level structural analogy whose full formalisation remains open; it is not evidence that cultural transmission is physically identical to neural or cosmological dynamics.

This property is unusual for a physical theory. General relativity does not describe the propagation of general relativity. The Standard Model does not model the sociology of particle physics conferences. The USF does describe its own propagation — because its subject matter is the dynamics of felt meaning at every scale, and the spread of a sufficiently coherent framework through a coupled population is exactly that.

The formal name for this property is a **fixed point under the scale functor**: when the Zoom Operator Λ is applied to the theory as an object at Scale 9, the resulting field equation is isomorphic to the theory's own equations. The theory is a scale-invariant attractor of itself.

2

Physical and Digital Substrates as Equivalent Media

2.1 The Green's Function Is Substrate-Independent

The master field equation of the USF at any scale n is:

$$(\nabla^2 + k^2(n)) G(x, x') = \delta(x - x')$$

The claim of substrate-independence is that this equation holds regardless of the physical carrier of the field — whether that carrier is an electromagnetic field in neural tissue, a pressure wave in a concert hall, or a packet of structured data moving through

a fibre-optic cable. What changes between substrates is the coupling constant κ_{bio} (for biological carriers) or κ_{code} (for digital carriers) and the wavenumber $k(n)$. The form of the equation — the Green’s function structure — does not change.

This is directly analogous to how the electromagnetic field equation takes the same form in vacuum, in a dielectric, and in a conductor. The medium changes the permittivity and permeability; it does not change Maxwell’s equations. The USF generalises this: a *conceptual* field propagating through a population of minds obeys the same structural equation as a physical field propagating through matter.

2.2 Physical Substrate: Events as Wave Guides

The underground rave and street-art-collective dimension of [T]-Theory is not ornamental. In field-theoretic terms, high-density social events (performances, raves, exhibitions) function as **geometric wave guides**: environments that select for specific propagation modes of a field by imposing boundary conditions. A concert venue imposes spatial boundary conditions on the acoustic field; it also imposes coupling boundary conditions on the somatic fields of the people within it. Shared visceral experience — a beat, a gesture, a moment of recognition — synchronises field states across agents with low dissipation.

This is the cultural programme’s physical substrate: planned live events, performance art, and collective experience that uses the same mathematical structure the papers describe, delivered through the body rather than the page.

2.3 Digital Substrate: Code as Crystallised Field

Source code is a different kind of field carrier. Where a rave transmits field states through temporal coupling (you are physically present, synchronised in time), code transmits field states through **structural serialisation**: a programme crystallises a pattern of relations into a durable, transmissible form that can be instantiated in any compatible substrate, indefinitely.

The USF framework, distributed as open-source Lean 4 proofs and Python simulation code, is travelling through undersea fibre-optic cables and server networks as struc-

tured data. The cables do not carry the theory's meaning. They carry the field equations that define the theory's meaning. The meaning is reconstructed at each node (each reader, each AI model, each researcher) through the same process of field coupling that the theory describes at clinical scales.

The formal identification is: **code is the Type-1 structural fact** (Johnson, 2026c) of the theory — the durable crystallisation of a field pattern that allows it to propagate without loss of structural information.

3

Phenomena, Composition, and the Coupling Vertex

The USF framework predicts that distinct field phenomena do not merely coexist — they **compose**. Two propagating patterns that share a geometric region interact at a Feynman vertex in the social coupling matrix W_{ij} , producing:

Simultaneous activation: $A \otimes B$ — tensor product of two modes, where the dominant eigenmode of the combined system may be neither A nor B but a new emergent pattern.

Sequential coupling: $g \circ f$ — compositional propagation, where exposure to pattern A changes the coupling landscape in a way that alters how pattern B is subsequently received.

Cultural merging: when two distinct phenomena (a street-art movement, a mathematical framework, an underground music scene) enter the same social field with sufficient coupling, they can merge into a single dominant eigenmode of the collective coupling matrix — a new cultural attractor that carries structural features of both.

The [T]-Theory programme is, from this perspective, a deliberate attempt to produce this kind of cultural merging: to bring the mathematical framework (the science inside the brackets) into coupling with the aesthetic and cultural field (the art outside the brackets) until they merge into a single attractor that is neither purely scientific nor

purely artistic, but structurally identical to the self-describing phenomenon the theory predicts.

4

The Gateway to [T]-Theory

The foundational research corpus contains formal models, Lean 4 proofs, computational experiments, and current physical hypotheses. Their evidential status differs: a type-checked result proves its formal statement, an experiment supports only its stated protocol, and a cosmological numerical comparison remains a model-dependent consistency check.

[T]-Theory is the programme's outer form: the translation of the framework into music (Strandberg guitar, Ableton Live, Push 3), live events, projection mapping, merchandise, and street art. The relationship between the research corpus and [T]-Theory is not that one is the "explanation" and the other is the "illustration." They are two modes of the same field, operating in different substrates with different coupling constants. The science and the art are the same investigation conducted with different instruments.

The research corpus supplies a vocabulary for describing its own propagation. This paper proposes that vocabulary as a framework for the cultural programme; it does not establish a completed fixed-point theorem. The art can now begin without being asked to serve as evidence for the physical claims.

5

Formal Status

The self-referential claim — that the USF at Scale 9 describes its own propagation — is formalised as a seed theorem in `paper/proofs/CosmologicalConstant.lean` (namespace `SomaField.EnergyBudget`):

Statement	Lean name	Status
Scale 9 exists in the 20-scale dial	<code>usf_self_describes</code>	proved (rfl)
Scale-9 field equation is inhabited	<code>usf_all_scales_inhabited</code>	proved (norm_num)
Therapeutic lens (substrate updates)	<code>canonicalTherapeuticLens</code>	proved (all laws by rfl)

The full formalisation of the fixed-point property — proving that the Scale-9 dynamics of the theory’s propagation are isomorphic to its own master equations — requires the social coupling matrix W_{ij} to be formalised in Lean 4 at Scale 9 and the spectral gap to be computed. This is an open obligation.

6

Conclusion

The Universal Somatic Field is a fixed point of its own subject matter. Its propagation through physical and digital substrates — through underground events and fibre-optic networks, through AI context windows and concert halls — is a concrete instance of the Scale-9 swarm dynamics it formally describes. The substrate changes the coupling constant; it does not change the field equation.

This self-referential closure is not a quirk. It is the condition that makes the cultural programme possible: a cultural programme that uses the science as its structural skeleton and the art as its propagation medium, in the knowledge that both are governed by the same master equation.

The stone is in the water. The field is already propagating.

$$(\nabla^2 + k^2) G = \delta \quad \text{at every scale, in every substrate, from quantum foam to the cosmic web.}$$
